    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: THE REACTION CATALYZED BY TOPOISOMERASES LEADS TO CONVERSION OF ONE TOPOLOGICAL ISOMER OF DNA TO ANOTHER. CATALYTIC ACTIVITY: ATP-INDEPENDENT BREAKAGE OF SINGLE-STRANCE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA, FOLLOWED BY PASSAGE AND REJOINING.
SUBUNIT: MONOMER (BY SIMILARITY).
MISCELLANEOUS: WHEN A TOPOISOMERASE TRANSIENTLY BREAKS A DNA
BACKBONE BOND, IT SIMULTANEOUSLY FORMS A PROTEIN-DNA LINK, I.
WHICH A TYROSYL OXYGEN IN THE ENZYME IS JOINED TO A DNA PHOS
AT ONE END OF THE ENZYME-SEVERED DNA STRAND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FOR MURAMIDASE-1. MAY FUNCTION IN FACILITATING SEPTUM FORMATION AND CELL SEPARATION. ACTIVE ON M.LUTEUS CELL WALLS AND ON E.HIRAE CELL WALL FRACTIONS, BUT NOT ACTIVE ON E.HIRAE INTACT CELL WALLS. CAN COVALENTLY BIND PENICULLIN.

CATALYTIC ACTIVITY: HYDROLYSIS OF THE 1,4-BETA-LINKAGES BETWEEN N-ACETYL-D-GLUCOSAMINE AND N-ACETYLMURAMIC ACID IN PEPTIDOGLYCAN HETEROPOLYMERS OF THE PROKARYOTES CELL WALLS.

SUBCELLULAR LOCATION: SECRETED.

DOMAIN: LYSM REPEATS ARE THOUGHT TO BE INVOLVED IN PEPTIDOGLYCAN

"Nucleotide sequence of the gene coding for Clostridium botulinum
(Clostridium argentinense) type G neurotoxin: genealogical comparison
with other clostridial neurotoxins.";
Biochim. Biophys. Acta 1216:487-491(1993).

-!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
                                                                                                                                                                                                                                                            STRAIN=113 / 30;

                                                              FUNCTION: LIGNIN DEGRADATION AND DETOXIFICATION OF LIGNIN-DERIVED PRODUCTS (PROBABLE).

CATALYTIC ACTIVITY: 4 BENZENEDIOL + O(2) = 4 BENZOSEMIQUINONE + 2 H(2)O.

CATALYTIC ACTIVITY: 4 BENZENEDIOL + O(2) = 4 BENZOSEMIQUINONE + COFACTOR: BINDS 4 CU-IONS PER MOLECULE. THREE DISTINCT CU CENTERS KNOWN AS TYPE 1 OR BLUE, TYPE 2 OR NORMAL, AND TYPE 3 OR COUPLED BINUCLEAR (BY SIMILARITY).

SUBCULT: HOMODIMER (BY SIMILARITY).

SUBCULTULAR LOCATION: SCREETED.

TISSUE SPECIFICITY: IN WYCELIA, AT A LOWER LEVEL THAN LCC4.

SIMILARITY: BELONGS TO THE FAMILY OF MULTICOPPER OXIDASES.

SIMILARITY: CONTAINS 3 PLASTOCYANIN-LIKE DOMAINS.

These nucleic cacid sequences can be used in the recombinant production of the CBP epitopes. The CBP protein and antigenic epitopes are contemplated for use in the treatment of pathological infections, especially to prevent bacterial adhesion to collagen. The claimed nucleic acids as well as claimed anti-CBP antibodies will also be of use in cscreening, diagnostic and therapeutic applications including active and passive immunisation and methods for the prevention of bacterial colonisation in an animal such as a human. These DNA segments and the peptides encoded by them are also contemplated for use in the preparation of vaccines and as carrier proteins in covaccine formulations, as well as in the formulation of compositions of the prevention of S. aureus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This nucleic acid comprises a portion of the Staphylococcus aureus cna gene that codes for collagen binding protein (CBP) epitope M31 (see AAW31553), i.e. amino acids 61-343 of full-length CBP. Claimed 441, 849 and 1500 bp nucleic acid sequences (see AAT93436-38) respectively encode CBP epitopes M17, M31 and M55 (see AAW31552-54)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antibody that interacts with collagen binding domain Staphylococcal cna gene product - useful to prevent k in animal infected with Staphylococcus aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

cna gene that codes for collagen binding protein (CBP) epithope MS5 (see AAW31554), i.e. amino acids 30-531 of full-length CBP. Claimed 41, 849 and 1500 bp nucleic acid sequences (see AAW315436-38) respectively encode CBP epitopes M17, M31 and M55 (see AAW3152-54) that confer protection against S. aureus infection. These nucleic acid sequences can be used in the recombinant production of the CBP epitopes. The CBP protein and antigenic epitopes are contemplated for use in the treatment of pathological infections, especially to prevent bacterial adhesion to collagen. The claimed nucleic acids as well as claimed anti-CBP antibodies will also be of use in
                                                                                                                                                                                                                                                                                                                                                                            Antibody that interacts with collagen binding domain of Staphylococcal cna gene product - useful to prevent bacterial sepsis in animal infected with Staphylococcus aureus
                                                                                                                                                                                                                                                                       This nucleic acid comprises a portion of the Staphylococcus aureus
                                                                                                                                                                                                                                                                                                                             Claim 40;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hook M,

These DNA segments and the peptides encoded by them are also contemplated for use in the preparation of vaccines and as carrier proteins in vaccine formulations, as well as in the formulation of compositions for the prevention of S. aureus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1500
